

Take home task - SDK generator

In this project, you will be building an SDK for an existing Lord of the Rings API.

Time requirement: Please spend as much time as you feel is necessary to complete the task. We ask you to submit the project code within 72 hours of starting.

First please [explore the API](#) and the different [endpoints](#).

Goal: write an SDK in Typescript, Python or Java that makes this API accessible to other developers. The SDK only needs to cover the **movie and quote endpoints**:

- /movie
- /movie/{id}
- /movie/{id}/quote
- /quote
- /quote/{id}

Points to Consider

- Pay attention to code quality and readability.
- Include filtering in the SDK.
- Include a testing case suite. Keep in mind we will be looking at the solutions architecture, testing, and documentation.
- Although you're not implementing all the endpoints, write the SDK as if you were. Keep maintainability and extensibility in mind.
- Modify the readme file for your SDK users specifying how to use and test the SDK.
- The SDK does not have to mirror the API. You can add abstractions and/or combine different calls.
- The SDK should be prepared for production; However, do not share your solution anywhere online or publish the SDK.
- Include a demonstration file(s) that can be used to test the SDK locally, along with instructions on how to run it.
- Create a [design.md](#) with information about your SDK design.

Do not use any code generation tools such as OpenAPI Generator. You can use AI tools if needed.

Submitting Your Solution

Once you have finished writing your solution, upload it to GitHub as a public repo and share the repo with us. The repo should be called "{your name} SDK".
